Re: Kohler Golf Course NOI

Dear Brooke,

On behalf of Kohler Company, Excel Engineering is submitting the following responses and/or additional information you requested in your February 6, 2018 email. Our responses are provided in the order presented in your email as follows.

General Storm Water Permit Requirements

- Documentation showing how the NHI requirements are satisfied – This work will be submitted under separate cover by Kohler Co.
- Documentation showing how the Archeological/Historic hits were resolved – This work will be submitted under separate cover by Kohler Co.
- Submit a complete set of digital plans – A set of digital plans are included with this transmittal.

Erosion Control Plan Requirements

- Describe the intended sequence of each stage of construction – The proposed construction sequence is provided in Section III (e) of the revised storm water management plan report.
- Rerun the USLE calculations using Version 2.0 – This was completed and updated calculations are included in the revised storm water management plan report in Appendixes D & E
- Revise the USLE calculations to utilize an increased duration of bare ground conditions and/or shift to a time of year with higher erosion rates – The updated USLE calculations mentioned in the previous bullet point were based upon shifting the time of year to summer (June 16 – August 16). The 2 month duration proposed is consistent with Kohler's plans to phase in "grow in" as quickly as possible.

Storm Water Plan Requirements

- Please clarify what filter strips will receive runoff based upon the proposed access road grades – Please see Appendix G where the drainage area tributary to the proposed Up-Flo Filter is delineated as well as the drainage areas around the access drive. A worst case drainage area that is tributary to the proposed filter strips is also shown and discussed further below.
- Revise the WinSLAMM calculations to use a “dynamic” infiltration rate of 6.5 inches/hour – The WinSLAMM calculations have been updated in the revised storm water management plan report.
- Show that NR151 peak discharge rate requirements will be met – In consultation with Pete Wood, Excel ran a WinSLAMM analysis for the entire developed area including the effects of the depression areas (depicted in Appendix L) using the Milwaukee 6392.rain rail file. This rain event exceeds the 2-year, 24-hour storm volume analysis required by the DNR. The SLAMM analysis shows no runoff will occur during the analyzed rain event. This is detailed in Section IV (f) of the revised storm water management plan report.
- Show that infiltration requirements will be met – The WinSLAMM results for the entire development discussed in previous bullet point show that the infiltration requirements will be met.
- How where representative areas selected for analysis and is it possible some filter strips will be bypassed – To address this question, in addition to the representative areas, WinSLAMM calculations have been added to the revised storm water management plan report that include areas of possible runoff concentration (worst case scenarios) along the proposed roadway, cart paths, maintenance building access driveway and the parking lot. The worst case areas are depicted on Appendices G, H & I. The WinSLAMM results for these areas all exceed the 80% TSS removal rate requirement. In addition, WinSLAMM calculations to represent the round-about area have also been added to the report.
- NR151 requires pre-treatment of the parking lot and drive areas prior to infiltration – After consultation with Pete Wood, Excel is proposing pre-treatment strips be installed along the proposed roadways, cart paths and parking lot. The pre-treatment strips are depicted throughout the plans and are shown in Appendices M & N. The pre-treatment strips area not included within the adjacent WinSLAMM filter strip calculations. There is no numerical requirement for pre-treatment performance and separate WinSLAMM calculations for the pre-treatment strips are not provided.
- Provide an explanation for why infiltration test #8 was redone - The first test was completed in a depression adjacent to a flowing artesian well that was installed as part

of the irrigation well testing. The surrounding area was artificially saturated which provided an erroneous result. Therefore, a second location was tested outside the area impacted by the well to obtain a more accurate and representative test result.

- Post-construction maintenance requirements including the specific inspection schedule for the filter strips and pre-treatment areas – The post-construction maintenance requirements have been updated to provide the specific inspection schedules requested and the manufactures requirements for maintaining the Hydro Up-Flo filter are also included. This is shown in Appendix A of the storm water management plan. Furthermore, this information has been incorporated into the proposed storm water maintenance agreement with the City of Sheboygan.
- The proposed storm water maintenance agreement with the City of Sheboygan is included with this transmittal. A final recorded version of this agreement will be provided when it is available.
- Are all of the proposed infiltration practices adequately separated from groundwater - Separation distances that meet the DNR requirements are provided and specifically discussed in Section III (d) of the storm water management plan.

Thank you for your assistance with this project. If you have any questions regarding this information, please don't hesitate to call.

Sincerely,

Jeff Quast, P.E.
President

I – Project Overview

Excel Engineering, Inc. has been retained by the Kohler Company to prepare this stormwater management and erosion control plan for a proposed 18-hole golf course in the City of Sheboygan in Sheboygan County. The proposed project is located in the City of Sheboygan bordered by the Timberlake subdivision to the north, Lake Michigan to the East, Black River to the west and the Kohler-Andrae State Park to the South. In addition to the golf course, the proposed development includes a driving range, club house, parking lot, cart storage building and maintenance facility. An entrance road and system of golf cart/maintenance paths will also be constructed as part of the project.

Due to the nature of this project, the storm water management and erosion control plan has been broken into five representative areas and an overall developed site area. The areas include the maintenance building area, club house & guest parking area, the entrance drive/cart path areas, caddie/cart barn area, and roundabout area. Detailed engineering plans including the proposed storm water management and erosion control devise locations are provided for all areas except the fairways. In the fairway areas, generally proposed grades are provided along with a defined corridor for each hole. Final grades will be determined in the field with land disturbance limited to the corridors identified. The fairways will be constructed of native sand and seeded, with no topsoil required for any growing medium.

The stormwater management plan is designed take advantage of the site's highly permeable sandy soils and low proposed impervious surface area (3%). The plan will result in zero stormwater runoff in the post-construction condition. In this manner, impacts to nearby wetland hydrology are minimized to the maximum extent possible and no runoff will leave the site. A Post Construction Operation and Maintenance Plan is provided as Appendix A

II – Existing Soil Information

According to the USGS Soils Map (see Appendix B), the existing on-site soil types are as follows:

Dn Dune Land, Type A
Bd, Beaches sand, Type A
Gb Granby loamy fine sand, Type A/D
OaB Oakville loamy fine sand, 0 to 6% slopes, Type A
OaC Oakville loamy fine sand, 6 to 12% slopes, Type A

Type A soils typically have high infiltration rates. To quantify the actual infiltration rates, ten double ring infiltration tests were taken throughout the property by PSI, Inc. in December of 2016. The soils were identified as uniform fine grained sand throughout the property. Infiltration test results ranged from 15.4 in/hr to 53in/hr. In addition to the tests completed in 2016, four double ring infiltrometer tests were also completed 2011 by Midwest Engineering. The soils were identified as fine grained sand in each test location and the infiltration test results ranged from 26in/hr to 52in/hr. Please see Appendix C for infiltration test locations and results.

Based upon the elevated infiltration test results throughout the property, an average infiltration rate was established for design purposes. The average total site infiltration rate based on 14 borings is 32.7 in/hr. Utilizing a correction safety factor of 2.5 as required by the Wisconsin Department of Natural Resources Technical Standard 1002 Table 3, a design rate of 13.1 in/hr. was assumed. Test #8 was not used as a part of the infiltration results. Test #8 was retested as Test #8A at a later date. Test #8 was completed in a depression adjacent to a flowing artesian well that was installed as part of the irrigation well testing. The surrounding area was artificially saturated which provided an erroneous result. Therefore, a second location was tested outside the area impacted by the well to obtain a more accurate and representative test result.

III – Applicable Stormwater Regulations and Requirements – Stormwater runoff and erosion control for the proposed project are regulated by the City of Sheboygan Storm Water Ordinance and the Wisconsin Natural Resources Code 151 and 216. The overall requirements are as follows.

- a) **Peak Discharge (Quantity)** - Post development storm water flow rates are required to be controlled by the City of Sheboygan and the State of Wisconsin. The City of Sheboygan requires the post-development 10-year, 24-hour runoff rate not exceed the 2-year, 24-hour pre-development runoff rate. The State of Wisconsin requires the post-development 24-hour runoff rate not exceed the pre-development 24-hour runoff rate for both the 1-year and 2-year storms. The maximum rainfall intensity during the 10 year event is 1.80 in/hr. (see below). With a design infiltration rate of 13.1 in/hr., the pre-development runoff rate during the 10-year storm will be zero. Post-development runoff rates will also be zero due to the extremely low percentage of proposed impervious surface, along with the high infiltration rates and the numerous on-site depressions. This significantly exceeds any of the requirements for peak discharge and will be discussed in more detail in the analysis section.

Duration	Annual 100-Year Uniform Return Period Intensity ¹									
	1	2	5	10	25	50	100	200	500	1000
5-min	0.324 (0.256-0.408)	0.386 (0.306-0.467)	0.406 (0.300-0.673)	0.566 (0.444-0.785)	0.672 (0.511-0.827)	0.780 (0.582-0.964)	0.826 (0.603-1.07)	0.900 (0.627-1.19)	0.993 (0.683-1.33)	1.06 (0.717-1.43)

45-min	1.04 (0.821-1.31)	1.23 (0.975-1.57)	1.55 (1.22-1.86)	1.80 (1.42-2.20)	2.15 (1.64-2.75)	2.42 (1.81-3.11)	2.68 (1.96-3.45)	2.94 (2.08-3.87)	3.27 (2.25-4.34)	3.52 (2.34-4.76)
2-hr	1.27 (1.02-1.58)	1.50 (1.21-1.87)	1.88 (1.51-2.23)	2.20 (1.75-2.75)	2.64 (2.04-3.34)	2.97 (2.26-3.80)	3.31 (2.45-4.29)	3.65 (2.62-4.79)	4.11 (2.85-5.47)	4.45 (3.01-5.80)
3-hr	1.42 (1.15-1.75)	1.67 (1.35-2.07)	2.08 (1.68-2.57)	2.46 (1.90-3.02)	2.95 (2.31-3.73)	3.35 (2.57-4.27)	3.77 (2.81-4.87)	4.20 (3.03-5.41)	4.79 (3.39-5.37)	5.29 (3.54-7.03)

- b) **Stormwater Quality** – The City of Sheboygan and State of Wisconsin require post-development storm water runoff be treated to remove 80% of the total suspended soils (TSS) load. As was previously stated, there will be no post-development runoff from the site. However, stormwater pretreatment and final treatment will be provided for runoff from impervious surface areas (roadways, cart paths, parking areas, building and maintenance areas) prior to discharging to grade in the form of pretreatment strips and filter strips. The proposed filter strips will provide stormwater TSS treatment from these areas for the protection of groundwater and sensitive areas. In addition, mechanical pretreatment

including oil and grease separators will be provided where appropriate for further protection. This approach significantly exceeds the requirements for stormwater quality and will be discussed in more detail in the analysis section.

- c) Stormwater Infiltration – The State of Wisconsin requires a post-development site to infiltrate 90% of the pre-development infiltration volume based on an average annual rainfall. In this case, 100% of the pre-development and post-development rainfall will be infiltrated which significantly exceeds the requirement. Specific details will be discussed in the analysis section.
- d) Protected Areas - The site development design will ensure that all drainage prior to flowing to any wetlands will be treated to WDNR standards using native sand filter strips (NR 151.125(4)e). Where the asphalt roads need to abut or cross through wetland areas, filter strips using native sand, will treat runoff prior to entering the surface water (NR 151.125(4)e). All best management practice areas will have adequate separation from the seasonal high groundwater per NR 151.124(4)(b) Table 3. The treatment strips for the impervious areas of the entrance road, driveways, parking areas and maintenance facility will have a minimum of 5 feet of separation from groundwater and the treatment strips for the cart paths will have a minimum of 3 feet of groundwater separation.
- e) Erosion Control - The erosion control specifications, site stabilization notes, seeding notes, and dewatering notes are all listed within the construction plan set. Silt fence and tracking pads will be added to protect the associated ASNRI waterways and wetlands areas.

Construction of the golf course will be completed in phases. Some phases may occur simultaneously depending upon site conditions. Prior to beginning each phase, silt fences will be installed along the planned limits of disturbance and clearing and grubbing will be completed. Site stabilization will occur as the phases are completed to minimize the potential for erosion and increase the time available for "grow in" which is important for golf course construction. Proposed post-construction BMPs will be in place as the phases are completed. Tracking pads will be provided between phases that are under construction and areas that are undeveloped or already completed. Temporary access roads will be constructed on the golf course to facilitate the phased construction. Construction of the access road from the State Park entrance, the maintenance facility, and the irrigation pond will begin first to support the construction and grow-in of the proposed golf course, followed by the start of golf hole construction, utility installations, clubhouse, caddy/cart building, rest stations and guest parking lot. It is anticipated that approximately nine holes will be completed annually, with the overall project being complete in approximately two years with variability due to weather conditions.

Appendices D & E of this report show the locations of the silt fence and tracking pads. The USLE (Version 2.0) sheets are also shown on these appendixes. The USLE sheets shown are the worst case flow paths to wetland areas. According to the USLE calculations silt fence with seeding and mulch are needed to achieve sediment discharges under 5.0 tons per acre.

IV – Stormwater & Erosion Control Analysis – Due to the nature of the proposed project, the stormwater management and erosion control analysis has been broken into five representative areas (See Appendix F – Overall Stormwater Management for areas) and an overall developed site area. The analysis is as follows.

- a) Maintenance Building Area - The runoff from the maintenance building yard area will drain to catchbasins and storm sewer to a mechanical unit (Up-Flow filter system) for treatment of TSS and oil and grease prior to being discharged to a sand depression. Separation will be greater than 5' from the treated storm sewer system outfall to the groundwater elevation (Outfall = 589.8, Groundwater = 584.00). The mechanical system will remove over 80% of the TSS and oil and grease with 18 filter modules. The access drives were modeled with 11' long filter strips which will remove over 80% of TSS prior to being discharged to grade. The first 4' of the strip adjacent to the pavement area is the pretreatment area and the remaining 7' of the filter strip will remove over 80% TSS. Roof areas are not required to be pretreated. The water quality components of the maintenance building area within the fueling and maintenance pavement area will be satisfied by achieving a greater than 80% TSS removal rate (82.2% see output summary below). The access drives will remove greater than 80% TSS with the 11' long filter strips. The filter strip was modeled at a worst case area. See attached map (Appendix G) for details of this area.

SLAMM Outfall Summary for the Up-Flow Filter with 18 modules:

Outfall Output Summary

	Runoff Volume [cu. ft.]	Percent Runoff Reduction	Runoff Coefficient (Rv)	Particulate Solids Conc. [mg/L]	Particulate Solids Yield [lbs]	Percent Particulate Solids Reduction

- b) Guest Parking & Club House Area - The parking area and access drives will be treated with filter strips which will remove over 80% of TSS prior to being discharged to grade. The roof areas are not required to be treated. All runoff from the roof areas will discharge to grade and infiltrate into the native sand around the perimeter of the buildings. Groundwater separation will be greater than 5' from the filter strips at the lowest elevation within this area (Filter strip = 587.34, Groundwater = 582.20). The parking lot, which has the largest impervious area within this area and was used for the calculations, has been designed to sheet drain to the west, south and east off the parking lot. A per unit area approach will be used for the filter strip calculations. A 10' section of the asphalt parking area (60' long) results in an analyzed drainage area from the parking area of 600 sf (per unit analysis). The filter strip for this area is 12' long. The first 4' of the strip adjacent to the pavement is the pretreatment area, the remaining 8' of the strip was modeled for the percentage of TSS removal. The majority of this area was modeled with a width of 10', flow length of 8', and a dynamic infiltration rate of 6.5 in/hr. SLAMM calculations show that typically 88.15% TSS reduction is achieved with an 8' long filter strip. See Appendix H for a map of this area.

SLAMM output for the typical parking lot area with 8' long, 10' wide filter strips:

Outfall Output Summary

	Runoff Volume (cu. ft.)	Percent Runoff Reduction	Runoff Coefficient (Rv)	Particulate Solids Conc. (mg/L)	Particulate Solids Yield (bs)	Percent Particulate Solids Reduction

- c) **Access Road & Cart Paths** - The access road and cart paths will be treated with filter strips which will remove over 80% of TSS prior to being discharged to grade. The filter strip for the access roads is 11' long and for the cart paths it is 9' long. The first 4' of the access road and the first 2' of the cart path strip adjacent to the pavement is the pretreatment area, the remaining 7' of the strip was modeled for the percentage of TSS removal. The access road has been designed as a crowned road that will sheet drain to the filter strip on each side of the driveway. The typical one half of the driveway section from the centerline is 12' of asphalt pavement. The cart paths are designed as a 10' to 12' wide asphalt path. The cart paths are designed to sheet drain from one edge of the path to the other to the filter strip. Because of the extents of the length of the road and cart paths on site, a per unit area approach will be used for the analysis, a width of 20' was used. A 20' section of the asphalt access road or cart path areas results in an analyzed drainage area from the asphalt of 240 sf (per unit analysis). The filter strip has been modeled with a width of 20', flow length of 7', and a dynamic infiltration rate of 6.5 in/hr. SLAMM calculations show that a 99.54% reduction is achieved in this length. Note that the percent of runoff from the road area is nearly zero. A worst case area that was not typical of most of the access road areas and cart paths were also modeled. See Appendix I for detailed map of this area.

SLAMM Outfall Output Summary for the typical access road and cart path area modeled with 7' long, 20' wide filter strips:

Outfall Output Summary

	Runoff Volume (cu. ft.)	Percent Runoff Reduction	Runoff Coefficient (Rv)	Particulate Solids Conc. (mg/L)	Particulate Solids Yield (lb)	Percent Particulate Solids Reduction
Total of All Land Uses without Controls	264.1		0.64	130.0	3.117	
Outfall Total with Controls	2.211	99.42 %	0.00	104.9	0.01448	99.54 %

d) Caddie/Cart Barn-

The Cart Barn roof area is designed to sheet drain to the north and south. The roof areas are not required to be pretreated. A filter strip is designed at the north and east edges of the asphalt area and will be used to collect the sheet flow from the roof and pavement area.

The filter strip for this area is 12' long with the first 4' along the pavement edge reserved as a pretreatment area. This strip has been modeled with a width of 213', a flow length of 8', and a dynamic infiltration rate of 6.5 in/hr. See attached map, Appendix J, for a close up of this area. SLAMM calculations show that due to the high infiltration rate of the soil that a 94.30% reduction is achieved from this sand filter strip.

SLAMM Outfall Output Summary for the cart barn:

Outfall Output Summary

	Runoff Volume (cu. ft.)	Percent Runoff Reduction	Runoff Coefficient (Rv)	Particulate Solids Conc. (mg/L)	Particulate Solids Yield (bs)	Percent Particulate Solids Reduction

- e) Roundabout area- The roundabout area is a redevelopment of the existing park entrance. The majority of this area would follow stormwater redevelopment standards. To keep the design conservative for this area the roundabout area will be treated with filter strips which will remove over 80% of TSS prior to being discharged to grade. The majority of the filter strips for the roundabout area are 11' long (Areas 1,2 &4), with the southern area along the car staging area at the park entrance at 14' long (Area 3). The first 4' of the filter strip, adjacent to the pavement, is the pretreatment area with the remaining 7' or 10' of the strip modeled for the percentage of TSS removal. Four drainage areas were modeled with a dynamic infiltration rate of 6.5 in/hr. The calculated percentage of TSS reduction for each area is shown below. See attached map (Appendix K) for details of this area.

Roundabout SLAMM Outfall Output for Area 1 with a calculated 7'long filter strip:

Outfall Output Summary

- f) Overall Development - An overall SLAMM analysis for the entire project area of the project was analyzed for both quality and quantity components.

Quality Control:

The overall development of the project is an area encompassing approximately 170 acres. This region includes all disturbed areas, impervious areas, irrigation pond, and the entire golf course area (fairways, driving range, existing trees, native areas between golf holes, etc.). The analysis includes all the best management practices throughout the development and also modeled all sand depressions within this area. The model only included the depressions within the developed area of the project and did not include any wetland areas or any of the numerous depressions outside of the development area zone. The SLAMM model included all the BMP's (filter strips, Up-Flo filters and the sand depressions) and a dynamic infiltration rate of 6.5 in/hr. The calculations show a 100% TSS reduction. Appendix L shows the limits of the entire developed area and the total area of sand depressions within the developed area.

SLAMM Outfall Output Summary for the total development:

Outfall Output Summary

	Runoff Volume (cu. ft.)	Percent Runoff Reduction	Runoff Coefficient (Rv)	Particulate Solids Conc. (mg/L)	Particulate Solids Yield (lb)	Percent Particulate Solids Reduction

With Controls	0.00	Good

Quantity Control 10 year 24 hour storm:

The calculated TR-55 post developed peak flow for the 170 acres of the developed portion of the project during the 10 year 24 hour storm is 1,915 cfs, with a generated volume of 62,820 cu.ft. (see calculations below). As noted previously, there are numerous depressions within the developed portion of the site containing a total 264,908 sf of area (See Appendix L). The 62,820 cu.ft. of volume runoff would be contained within 3 inches of depth of the 264,908 sf of the depressions. The depressions along with the extremely high infiltration rates will contain all runoff within the developed portion of the project. The depressions noted and mapped within the developed site does not include all the on-site wetlands and all the depressions located adjacent and outside of the developed area (but still on the property) as well. The post-development runoff rates will be zero due to the extremely low percentage of proposed impervious surface, along with the high infiltration rates and the numerous on-site depressions.

Appendix A

POST CONSTRUCTION OPERATION AND MAINTENANCE PLAN

The owner of the property affected shall inspect and maintain the following stormwater management systems frequently, especially after heavy rainfalls, but at least on an annual basis unless otherwise specified.

STORMWATER FACILITY	TYPE OF ACTION
1. Lawn and Landscaped Areas	All lawn areas shall be kept clear of any materials that block the flow of stormwater. Rills and small gullies shall immediately be filled and reestablished with native vegetation.
2. Swales	All swales showing signs of erosion, scour, or channelization shall be repaired, reinforced, and revegetated immediately. All swales shall be repaired to the original plan requirements.
3. Filter Strips	The surface areas over the pretreatment area and filter strip area shall be inspected for any type of settling or clogging that may take place on an annual basis. Any failed areas showing signs of degradation shall be restored to the original plan requirements.
4. Hydro International Up-Flo Filter Quality Structures	Inspection of the structure shall be completed annually at a minimum by qualified maintenance personnel. Sediment in the bottom of the structure shall be inspected to verify sediment is less than 16" deep. If sediment is greater than 16" deep, the sediment shall be removed per Hydro International requirements. Qualified maintenance personnel shall enter structure to remove a Media Bag to be weighed. Media Bags weighing more than 40 lbs are an indication that the bag is full and need to be replaced. Replace per manufacturer specifications. Qualified maintenance personnel shall inspect the oil layer on the water surface to oil being entrained in the Media Bags. If the oil accumulation is greater than 1.5", the structure shall be pumped per manufacturer's specifications. After storm events of greater than 1" of rainfall, the structure shall be inspected 48 hours after the rainfall even to verify the water level inside the structure has dropped to below the base of the filter modules. If the water level has not dropped, the filters are considered to be clogged and shall be replaced per manufacturer's specifications. For further information, obtain Hydro International's Up-Flo Filter Operation and Maintenance Manual for details.
5. Record of Maintenance	The operation and maintenance plan shall remain onsite and be available for inspection when requested by WDNR. When requested, the owner shall make available for inspection all maintenance records to the department or agent for the life of the system.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
 Web Soil Survey URL:
 Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below:

Soil Survey Area: Sheboygan County, Wisconsin
 Survey Area Data: Version 12, Sep 27, 2016
 Soil map units are labeled (as space allows) for map scales 1:50,000 or larger
 Date(s) aerial images were photographed: Apr 29, 2011—Jun 3, 2015

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Subject: Double-Ring Infiltrometer Testing and Infiltration Evaluation
Tented Forest Parcel
Town of Wilson, Sheboygan County, Wisconsin
MES Project No. 7-113182

Dear Mr. Drazkowski,

INTRODUCTION

In accordance with your request, Midwest Engineering Services, Inc. (MES) has performed modified double-ring infiltrometer testing to provide a preliminary evaluation of the soil infiltration rates for four (4) specific locations on the Tented Forest Parcel, located in the Town of Wilson, Sheboygan County, Wisconsin, which is situated along Lake Michigan. A fifth test was eliminated due to access issues in that area of the site. The results of these tests are summarized in this report. Hard copies of this report can be provided upon request.

These recent services were performed in accordance with an agreement (MES Proposal No. 7-11341, dated December 14, 2011) between MES and Excel Engineering and signed by Mr. Jeffrey Quast, President of Excel Engineering, on December 22, 2011. The general conditions for the performance of the work were referenced in the proposal. This Infiltration evaluation report has been prepared on behalf of, and exclusively for the use of the Excel Engineering. The information contained in this letter report may not be relied upon by any other parties without the written consent of MES, and acceptance by such parties of MES General Conditions.

PURPOSE

The purpose of the infiltrometer tests was to aid in assessing the average rate of infiltration of water into the vegetated surface soils at predetermined locations on the Tented Forest Parcel.

SCOPE

The scope of services included a site reconnaissance, field observations of the existing surface conditions, performance of infiltrometer tests, and an evaluation and analysis of the

Double-Ring Infiltrometer Testing and Infiltration Evaluation
Tented Forest Parcel
Town of Wilson, Sheboygan County, Wisconsin
MES Project No. 7-113182
Page 2

data obtained. The double ring tests were performed in the general locations specified by Excel Engineering. Initially, a total of five (5) tests were to be completed. However, due to the inaccessible nature of one (1) of the test locations (Test Location 1), it was eliminated from the scope. In addition, three other tests (Test Locations 3, 4 and 5), which were initially located near Lake Michigan on existing sand dunes, were relocated to western locations due to encountered surface condition access issues at the predetermined locations. Further, no soil sampling services were performed.

The field work for the performance of the infiltration tests were in general accordance with the guidelines expressed in the WDNR modified procedures for performing a double ring infiltrometer test per ASTM D3385. The design of the proposed swales and other devices was beyond the scope of services for this project.

SITE AND PROJECT DESCRIPTION

The project area is located within the Town of Wilson, Sheboygan County, Wisconsin. It consists of a large, heavily wooded area along Lake Michigan and south of the Timber Lake Subdivision, north of the Kohler-Andrae State Park and east of the Black River. The topography of the site is considered to be rolling with dunes along Lake Michigan. It is understood that the site development will consist of twelve (12) tented structures (Mongolian Yurts), a restaurant, a recreation tent structure, and a picnic area on the sand dunes along Lake Michigan; a maintenance building with a parking area in the southwest corner; and a reception structure with a guest parking area in the northwest corner. It is also understood that the site development will also attempt to maintain the site infiltration as natural as possible and any constructed impervious areas and any roof runoff will be designed to drain into the existing vegetated areas with no stormwater runoff leaving the site. Five (5) separate locations were initially proposed to be evaluated for this project and were anticipated to be accessible with a support truck. However, the area of Test Location 1, which was proposed to be located in the northwest portion of the site, was inaccessible with a support truck and was eliminated by Excel. Further, the initial locations of Test Locations 3, 4 and 5 were also inaccessible and were subsequently relocated to accessible locations of the site. The test locations are shown on the attached location diagram.

It is understood that the scope of the project is to evaluate the existing vegetated areas regarding infiltration rates to assist in the design of any proposed stormwater management devices.

FIELD CONDITIONS AND INFILTROMETER TESTING PROCEDURES

As proposed, MES performed field double ring Infiltrometer tests in general accordance with WDNR modified procedures based upon ASTM D3385 standards. These tests were performed at four (4) specific locations on the parcel. The double ring method consists of placing two open-ended cylinders into the ground at the test location, with one cylinder inside the other. The rings were set approximately 4 to 6 inches into the vegetated surface. Per the

Double-Ring Infiltrometer Testing and Infiltration Evaluation
Tented Forest Parcel
Town of Wilson, Sheboygan County, Wisconsin
MES Project No. 7-113182
Page 3

WDNR standard, the grass was not removed during the test procedures. Both of the rings are then filled with clean water. Once an equal depth of water is obtained within each ring, the water level within the inner ring is allowed drop to a predetermined depth, typically one inch. The time it takes the water to drop the predetermined depth is recorded. Per WDNR requirements, these test procedures were performed until an apparent uniform infiltration rate was achieved or for a minimum of two (2) hours. The volume of water added to the inner ring is that which infiltrates into the soils. The maximum steady-state infiltration velocity is equal to the infiltration rate.

In general, the vegetated surfaces of the test locations consisted of a thin layer of about 1 to 3 inches of root mat with fine sand. Some unvegetated areas were observed on the site, but generally in the areas of the eastern sand dunes.

SOIL SURVEY MAP REVIEW

The USDA Soil Conservation Survey for Sheboygan County, Wisconsin, dated January 1978, indicated the near surface soils in the vicinity of Test Location 1 (which was eliminated due to area access issues) and Test Location 2, consist of the Oakfield Loamy Fine Sand (OaB), while the near surface soils in the vicinity of Test Location 3, 4, and 5 consist of Dune Land (Dn). The Oakville soils generally consist of shallow loamy fine sand with underlying sand. Estimated permeability (infiltration rate) was indicated to be 6 to 20 inches per hour for the loamy fine sand and greater than 20 inches per hour for the sand. Though no estimated infiltration rates were indicated for the Dune Land soils due to its variable consistency, its description in the Soil Survey document indicated that these soils are excessively drained medium and fine sand with a very rapid permeability.

CONCLUSIONS OF INFILTROMETER TESTING

The following table summarizes the test location, surface condition, and the measured average infiltration rate. Results of the individual field infiltrometer test are also attached to this letter report.

Test Location	Date Tested	Test Depth	Surface Description	Average Infiltration Rate (in./hour)
#2	12-18-11	At grade	Sparcely Vegetated Loamy Fine Sand	26
#3	12-18-11	At grade	Sparcely Vegetated Fine Sand	33
#4	12-19-11	At grade	Sparcely Vegetated Fine Sand	41
#5	12-19-11	At grade	Sparcely Vegetated Fine Sand	52

In general, the infiltration rate is based on the average incremental infiltration velocity measured from the inner ring. The outer ring is to promote one-dimensional flow beneath the inner ring; therefore outer ring measurements were not collected. However, water was periodically added to the outer ring to maintain a general equal water level with the inner ring. It should be recognized that the infiltration rate could be affected by such factors as the condition of the soil surface, soil structure/layering, percentage of gravel or larger material, degree of saturation, and depth to the water table or bedrock. In summary, it should be recognized that the infiltration rates at these specific locations are expected to be somewhat variable depending upon the uniformity, and the in-place density of the subsoils below the individual infiltration areas.

At test locations, the average measured infiltration rates ranged from 26 to 52 inches per hour. However, it is indicated within the ASTM description of the Double Ring Standard (ASTM D3385), that the "test method is difficult to use or the resultant data may be unreliable, or both, in very pervious or impervious soils (soils with a hydraulic conductivity greater than about 14 inches per hour or less than about 0.0014 inches per hour)." The measured rates are greater than 14 inches per hour and must therefore be used with extreme caution when performing stormwater management area design. It may therefore be advisable to utilize either a limiting value of 14 inches per hour, or the infiltration rates provided for these soil textures in the NRCS Survey for Sheboygan County, when conducting the stormwater management area design. These rates expressed in the NRCS Survey document ranged from 6 to 20 inches per hour for the shallow soils around Test Locations 1 and 2, and to potentially greater than 20 inches per hour for the surface soils around Test Locations 3, 4, and 5.

GENERAL COMMENTS

The limited evaluation has been prepared on the basis of the conditions encountered at the test locations discussed above. Preliminary recommendations presented herein are based on available information and test data collected. This study has been conducted in the manner consistent with that level of care ordinarily exercised by members of the profession currently practicing in the same locality under similar conditions. The findings and opinions contained herein have been promulgated in accordance with general accepted practices in the fields of soil mechanics and engineering geology. No other representations, expressed or implied, and no warranty or guarantee is included or intended in this report.

After you have had the opportunity of reading this report, please call at any time with any questions or comments you may have. MES appreciates the opportunity to be of service on this project.

Attn: Mr. Jess Barley
Senior Staff Project Manager

Subject: Double-Ring Infiltrometer Testing and Infiltration Evaluation
Kohler Parcel
Town of Wilson, Sheboygan County, Wisconsin
PSI Project No. 00541315

Dear Mr. Barley,

INTRODUCTION

In accordance with your request, Professional Service Industries (PSI), has performed modified double-ring infiltrometer testing to provide a preliminary evaluation of the soil infiltration rates for ten (10) specific locations on the Kohler Parcel, located in the Town of Wilson, Sheboygan County, Wisconsin, which is situated along Lake Michigan. The results of these tests are summarized in this report. Hard copies of this report will be provided upon request.

These recent services were performed under a signed contact between PSI and Kohler Company, dated November 11, 2016. The general conditions for the performance of the work were referenced in PSI's Proposal (Proposal No. 0054194179, dated November 8, 2016), which was included in the contract as Exhibit A. This infiltration evaluation report has been prepared on behalf of, and exclusively for the use of the Kohler Company. The information contained in this letter report may not be relied upon by any other parties without the written consent of PSI.

PURPOSE

The purpose of the infiltrometer tests was to aid in assessing the average rate of infiltration of water into the vegetated surface soils at predetermined locations on the Kohler Parcel.

SCOPE

The scope of services included a site reconnaissance, field observations of the existing

Double-Ring Infiltrometer Testing and Infiltration Evaluation
Kohler Parcel
Town of Wilson, Sheboygan County, Wisconsin
PSI Project No. 00541315
Page 2

surface conditions, performance of infiltration tests, and an evaluation and analysis of the data obtained. The double ring tests were performed in the general locations specified by the Client. A total of ten (10) tests were completed. No soil sampling services were performed. The field work for the performance of the infiltration tests were in general accordance with the guidelines expressed in the WDNR modified procedures for performing a double ring infiltration test per ASTM D3385. The design of the proposed swales and other devices was beyond the scope of services for this project.

SITE AND PROJECT DESCRIPTION

The project area is located within the Town of Wilson, Sheboygan County, Wisconsin. It consists of a large, heavily wooded area along Lake Michigan and south of the Timber Lake Subdivision, north of the Kohler-Andrae State Park and east of the Black River. The topography of the site is considered to be rolling with dunes along Lake Michigan. It is understood that the site development will consist of a golf course. Ten (10) separate locations were evaluated for this project, and the test locations are shown on the attached location diagram.

It is understood that the scope of the project is to evaluate the existing vegetated areas regarding infiltration rates to assist in the design of any proposed stormwater management devices.

FIELD CONDITIONS AND INFILTROMETER TESTING PROCEDURES

As proposed, PSI performed field double ring infiltration tests in general accordance with WDNR modified procedures based upon ASTM D3385 standards. These tests were performed at ten (10) specific locations on the parcel. The double ring method consists of placing two open-ended cylinders into the ground at the test location, with one cylinder inside the other. The rings were set approximately 4 to 6 inches into the vegetated surface. Per the WDNR standard, the grass/vegetation was not removed during the test procedures. Both of the rings were then filled with clean water. Once an equal depth of water was obtained within each ring, the water level within the inner ring was allowed to drop to a predetermined depth, typically one inch. The time it takes the water to drop the predetermined depth was recorded. Per WDNR requirements, these test procedures were performed until an apparent uniform infiltration rate was achieved or for a minimum of two (2) hours. The volume of water added to the inner ring is that which infiltrates into the soils. The maximum steady-state infiltration velocity is equal to the infiltration rate.

In general, the vegetated surfaces of the test locations consisted of a thin layer of about 1 inch of root mat with fine sand to loamy fine sand.

SOIL SURVEY MAP REVIEW

The USDA Soil Conservation Survey for Sheboygan County, Wisconsin, dated January 1978, indicated the near surface soils in the vicinity of Test Locations 1, 2, 4, 7, 8, and 9 consist of the Oakville Loamy Fine Sand (OaB and OaC), while the near surface soils in the vicinity of Test Location 2, 3, 5, 6, and 10 consist of Dune Land (Dn). The Oakville soils generally consist of shallow loamy fine sand with underlying sand. Estimated permeability (infiltration rate) was indicated to range from about 6 to 20 inches per hour for the loamy fine sand and greater than 20 inches per hour for the sand. Though no estimated infiltration rates were indicated for the Dune Land soils due to its variable consistency, its description in the Soil Survey document indicated that these soils are excessively drained medium and fine sand with a very rapid permeability.

CONCLUSIONS OF INFILTROMETER TESTING

The following table summarizes the test location, surface condition, and the measured average infiltration rate. Results of the individual field infiltrometer tests are also attached to this letter report.

Test Location	Date Tested	Test Depth	Surface Description	Average Infiltration Rate (in./hour)
#1	12-7-16	At grade	Sparsely Vegetated Loamy Fine Sand	15.4
#2	12-6-16	At grade	Sparsely Vegetated Fine Sand	46
#3	12-6-16	At grade	Sparsely Vegetated Fine Sand	53
#4	12-7-16	At grade	Sparsely Vegetated Loamy Fine Sand	23.5
#5	12-7-16	At grade	Sparsely Vegetated Fine Sand	34.2
#6	12-5-16	At grade	Sparsely Vegetated Fine Sand	26.3
#7	12-5-16	At grade	Sparsely Vegetated Loamy Fine Sand	17.5
#8	12-5-16	At grade	Sparsely Vegetated Loamy Fine Sand	26.9 29.8
#9	12-7-16	At grade	Sparsely Vegetated Loamy Fine Sand	34.7
#10	12-6-16	At grade	Sparsely Vegetated Fine Sand	24.7

In general, the infiltration rate is based on the average incremental infiltration velocity measured from the inner ring. The outer ring is to promote one-dimensional flow beneath the inner ring; therefore outer ring measurements were not collected. However, water was periodically added to the outer ring to maintain a general equal water level with the inner ring. It should be recognized that the infiltration rate could be affected by such factors as the condition of the soil surface, soil structure/layering, percentage of gravel or larger material, degree of saturation, and depth to the water table or bedrock. In summary, it should be recognized that the infiltration rates at these specific locations are expected to be somewhat variable depending upon the uniformity, and the in-place density of the subsoils below the individual infiltration areas.

At test locations, the average measured infiltration rates ranged from 4.59 to 53 inches per hour. However, it is indicated within the ASTM description of the Double Ring Standard (ASTM D3385), that the "test method is difficult to use or the resultant data may be unreliable, or both, in very pervious or impervious soils (soils with a hydraulic conductivity greater than about 14 inches per hour or less than about 0.0014 inches per hour)." The measured rates are greater than 14 inches per hour and must therefore be used with extreme caution when performing stormwater management area design. It may therefore be advisable to utilize either a limiting value of 14 inches per hour, or the infiltration rates provided for these soil textures in the NRCS Survey for Sheboygan County, when conducting the stormwater management area design. These rates expressed in the NRCS Survey document ranged from 6 to 20 inches per hour for the shallow soils around Test Locations 1, 4, 7, 8, and 9 and to potentially greater than 20 inches per hour for the surface soils around Test Locations 2, 3, 5, 6, and 10.

GENERAL COMMENTS

The limited evaluation has been prepared on the basis of the conditions encountered at the test locations discussed above. Preliminary recommendations presented herein are based on available information and test data collected. This study has been conducted in the manner consistent with that level of care ordinarily exercised by members of the profession currently practicing in the same locality under similar conditions. The findings and opinions contained herein have been promulgated in accordance with general accepted practices in the fields of soil mechanics and engineering geology. GENERAL NOTES

SAMPLE IDENTIFICATION

The Unified Soil Classification System (USCS), AASHTO 1988 and ASTM designations D2487 and D-2488 are used to identify the encountered materials unless otherwise noted. Coarse-grained soils are defined as having more than 50% of their dry weight retained on a #200 sieve (0.075mm); they are described as: boulders, cobbles, gravel or sand. Fine-grained soils have less than 50% of their dry weight retained on a #200 sieve; they are defined as silts or clay depending on their Atterberg Limit attributes. Major constituents may be added as modifiers and minor constituents may be added according to the relative proportions based on grain size.

DRILLING AND SAMPLING SYMBOLS

SFA:	Solid Flight Auger - typically 4" diameter flights, except where noted.	<input type="checkbox"/>	SS: Split-Spoon - 1 3/8" I.D., 2" O.D., except where noted.
HSA:	Hollow Stem Auger - typically 3 1/4" or 4 1/4 I.D. openings, except where noted.	<input checked="" type="checkbox"/>	ST: Shelby Tube - 3" O.D., except where noted.
M.R.:	Mud Rotary - Uses a rotary head with Bentonite or Polymer Slurry	<input type="checkbox"/>	RC: Rock Core
R.C.:	Diamond Bit Core Sampler	<input type="checkbox"/>	TC: Texas Cone
H.A.:	Hand Auger	<input type="checkbox"/>	BS: Bulk Sample
P.A.:	Power Auger - Handheld motorized auger	<input checked="" type="checkbox"/>	PM: Pressuremeter
			CPT-U: Cone Penetrometer Testing with Pore-Pressure Readings

SOIL PROPERTY SYMBOLS

N:	Standard "N" penetration: Blows per foot of a 140 pound hammer falling 30 inches on a 2-inch O.D. Split-Spoon.
N ₆₀ :	A "N" penetration value corrected to an equivalent 60% hammer energy transfer efficiency (ETR)
Q _c :	Unconfined compressive strength, TSF
Q _p :	Pocket penetrometer value, unconfined compressive strength, TSF
w%:	Moisture/water content, %
LL:	Liquid Limit, %
PL:	Plastic Limit, %
PI:	Plasticity Index = (LL-PL), %
DD:	Dry unit weight, pcf
V, Z:	Apparent groundwater level at time noted

RELATIVE DENSITY OF COARSE-GRAINED SOILS ANGULARITY OF COARSE-GRAINED PARTICLES

Relative Density	N - Blows/foot
Very Loose	0 - 4
Loose	4 - 10
Medium Dense	10 - 30
Dense	30 - 50
Very Dense	50 - 80
Extremely Dense	80+

Description	Criteria
Angular:	Particles have sharp edges and relatively plane sides with unpolished surfaces
Subangular:	Particles are similar to angular description, but have rounded edges
Subrounded:	Particles have nearly plane sides, but have well-rounded corners and edges
Rounded:	Particles have smoothly curved sides and no edges

GRAIN-SIZE TERMINOLOGY

Component	Size Range
Boulders:	Over 300 mm (>12 in.)
Cobbles:	75 mm to 300 mm (3 in. to 12 in.)
Coarse-Grained Gravel:	19 mm to 75 mm (3/4 in. to 3 in.)
Fine-Grained Gravel:	4.75 mm to 19 mm (No. 4 to 3/4 in.)
Coarse-Grained Sand:	2 mm to 4.75 mm (No. 10 to No. 4)
Medium-Grained Sand:	0.42 mm to 2 mm (No. 40 to No. 10)
Fine-Grained Sand:	0.075 mm to 0.42 mm (No. 200 to No. 40)
Silt:	0.005 mm to 0.075 mm
Clay:	<0.005 mm

PARTICLE SHAPE

Description	Criteria
Flat:	Particles with width/thickness ratio > 3
Elongated:	Particles with length/width ratio > 3
Flat & Elongated:	Particles meet criteria for both flat and elongated

RELATIVE PROPORTIONS OF FINES

Descriptive Term	% Dry Weight
Trace:	< 5%
With:	5% to 12%
Modifier:	>12%

GENERAL NOTES

(Continued)

CONSISTENCY OF FINE-GRAINED SOILS

<u>Q_s - TSF</u>	<u>N - Blows/foot</u>	<u>Consistency</u>
0 - 0.25	0 - 2	Very Soft
0.25 - 0.50	2 - 4	Soft
0.50 - 1.00	4 - 8	Firm (Medium Stiff)
1.00 - 2.00	8 - 15	Stiff
2.00 - 4.00	15 - 30	Very Stiff
4.00 - 8.00	30 - 50	Hard
8.00+	50+	Very Hard

MOISTURE CONDITION DESCRIPTION

<u>Description</u>	<u>Criteria</u>
Dry	Absence of moisture, dusty, dry to the touch.
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table
<u>RELATIVE PROPORTIONS OF SAND AND GRAVEL</u>	
<u>Descriptive Term</u>	<u>% Dry Weight</u>
Trace	< 15%
With	15% to 30%
Modifier	>30%

STRUCTURE DESCRIPTION

<u>Description</u>	<u>Criteria</u>	<u>Description</u>	<u>Criteria</u>
Stratified	Alternating layers of varying material or color with layers at least $\frac{1}{4}$ -inch (6 mm) thick	Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown
Laminated	Alternating layers of varying material or color with layers less than $\frac{1}{4}$ -inch (6 mm) thick	Lensed	Inclusion of small pockets of different soils
Fissured	Breaks along definite planes of fracture with little resistance to fracturing	Layer	Inclusion greater than 3 inches thick (75 mm)
Slickensided	Fracture planes appear polished or glossy, sometimes striated	Seam	Inclusion 1/8-inch to 3 inches (3 to 75 mm) thick extending through the sample
		Parting	Inclusion less than 1/8-inch (3 mm) thick

SCALE OF RELATIVE ROCK HARDNESS

<u>Q_s - TSF</u>	<u>Consistency</u>
2.5 - 10	Extremely Soft
10 - 50	Very Soft
50 - 250	Soft
250 - 525	Medium Hard
525 - 1,050	Moderately Hard
1,050 - 2,600	Hard
>2,600	Very Hard

ROCK BEDDING THICKNESSES

<u>Description</u>	<u>Criteria</u>
Very Thick Bedded	Greater than 3-foot (>1.0 m)
Thick Bedded	1-foot to 3-foot (0.3 m to 1.0 m)
Medium Bedded	4-inch to 1-foot (0.1 m to 0.3 m)
Thin Bedded	1 1/2-inch to 4-inch (30 mm to 100 mm)
Very Thin Bedded	1/2-inch to 1 1/2-inch (10 mm to 30 mm)
Thickly Laminated	1/8-inch to 1/2-inch (3 mm to 10 mm)
Thinly Laminated	1/8-inch or less "paper thin" (<3 mm)

ROCK VOIDS

<u>Voids</u>	<u>Void Diameter</u>
Pit	<6 mm (<0.25 in)
Vug	6 mm to 50 mm (0.25 in to 2 in)
Cavity	50 mm to 600 mm (2 in to 24 in)
Cave	>600 mm (>24 in)

GRAIN-SIZED TERMINOLOGY

<u>(Typically Sedimentary Rock)</u>	
<u>Component</u>	<u>Size Range</u>
Very Coarse Grained	>4.76 mm
Coarse Grained	2.0 mm - 4.76 mm
Medium Grained	0.42 mm - 2.0 mm
Fine Grained	0.075 mm - 0.42 mm
Very Fine Grained	<0.075 mm

ROCK QUALITY DESCRIPTION

<u>Rock Mass Description</u>	<u>RQD Value</u>
Excellent	90 - 100
Good	75 - 90
Fair	50 - 75
Poor	25 - 50
Very Poor	Less than 25

Slightly Weathered: Rock generally fresh, joints stained and discoloration extends into rock up to 25 mm (1 in), open joints may contain clay, core rings under hammer impact.

Weathered: Rock mass is decomposed 50% or less, significant portions of the rock show discoloration and weathering effects, cores cannot be broken by hand or scraped by knife.

Highly Weathered: Rock mass is more than 50% decomposed, complete discoloration of rock fabric, core may be extremely broken and gives clunk sound when struck by hammer, may be shaved with a knife.

SOIL CLASSIFICATION CHART

NOTE: DUAL SYMBOLS ARE USED TO INDICATE BORDERLINE SOIL CLASSIFICATIONS

MAJOR DIVISIONS			SYMBOLS		TYPICAL DESCRIPTIONS
			GRAPH	LETTER	
COARSE GRAINED SOILS MORE THAN 50% OF MATERIAL IS LARGER THAN NO. 200 SIEVE SIZE	GRAVEL AND GRAVELLY SOILS MORE THAN 50% OF COARSE FRACTION RETAINED ON NO. 4 SIEVE	CLEAN GRAVELS (LITTLE OR NO FINES)		GW	WELL-GRADED GRAVELS, GRAVEL - SAND MIXTURES, LITTLE OR NO FINES
		GRAVELS WITH FINES (APPRECIABLE AMOUNT OF FINES)		GP	Poorly-graded gravels, gravel - sand mixtures, little or no fines
				GM	SILTY GRAVELS, GRAVEL - SAND - SILT MIXTURES
				GC	CLAYEY GRAVELS, GRAVEL - SAND - CLAY MIXTURES
	SAND AND SANDY SOILS MORE THAN 50% OF COARSE FRACTION PASSING ON NO. 4 SIEVE	CLEAN SANDS (LITTLE OR NO FINES)		SW	WELL-GRADED SANDS, GRAVELLY SANDS, LITTLE OR NO FINES
				SP	Poorly-graded sands, gravelly sand, little or no fines
		SANDS WITH FINES (APPRECIABLE AMOUNT OF FINES)		SM	SILTY SANDS, SAND - SILT MIXTURES
				SC	CLAYEY SANDS, SAND - CLAY MIXTURES
FINE GRAINED SOILS MORE THAN 50% OF MATERIAL IS SMALLER THAN NO. 200 SIEVE SIZE	SILTS AND CLAYS LIQUID LIMIT LESS THAN 50			ML	INORGANIC SILTS AND VERY FINE SANDS, ROCK FLOUR, SILTY OR CLAYEY FINE SANDS OR CLAYEY SILTS WITH SLIGHT PLASTICITY
				CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
				OL	ORGANIC SILTS AND ORGANIC SILTY CLAYS OF LOW PLASTICITY
				MH	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SAND OR SILTY SOILS
	SILTS AND CLAYS LIQUID LIMIT GREATER THAN 50			CH	INORGANIC CLAYS OF HIGH PLASTICITY
				OH	ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS
				PT	PEAT, HUMUS, SWAMP SOILS WITH HIGH ORGANIC CONTENTS
		HIGHLY ORGANIC SOILS

Control Practice 1: Filter Strip CP# 1 (DS) - DS Filter Strips # 5

Total drainage area (acres)= 12.173

Fraction of drainage area served by filter strips (ac) = 1.00

Total filter strip width (ft) = 40644.0

Effective flow length (ft) = 12

Infiltration rate (in/hr) = 6.500

Typical longitudinal slope (ft/ft. V) = 0.040

Typical grass height (in) = 2.0

Swale retardance factor = C

Use stochastic analysis to determine infiltration rate False

Infiltration rate coefficient of variation (COV) = 0.00

Particle size distribution file name Not needed - calculated by program

Surface Clogging Load (lbs/sf) = 3.50

Control Practice 2: Upflo Filter CP# 1 (DS) - DS UpfloFilter # 1

Media Type CPZ

Fraction of Area Served by Upflo Filters (0-1) 1.0

Height from Outlet Invert to Structure Top (ft) 5.0

Sump Depth (ft) 2.00

Sump Cleaning/Filter Replacement is not considered during the model run

Solve for Given Conditions

Number of filters 18

Upflo Filter particle size distribution file name Not needed - calculated by program

Control Practice 3: Biofilter CP# 1 (DS) - DS Biofilters # 3

1. Top area (square feet) = 6112

2. Bottom area (square feet) = 965

3. Depth (ft) 3.2

4. Biofilter width (ft) - for Cost Purposes Only 10

5. Infiltration rate (in/hr) = 6.5

6. Random infiltration rate generation? No

7. Infiltration rate fraction (side) 1

8. Infiltration rate fraction (bottom) 1

9. Depth of biofilter that is rock filled (ft) 0

10. Porosity of rock filled volume = 0

11. Engineered soil infiltration rate 0

12. Engineered soil depth (ft) 0

13. Engineered soil porosity = 0

14. Percent solids reduction due to flow through engineered soil = 0

15. Biofilter peak to average flow ratio = 3.8

16. Number of biofiltration control devices = 1

17. Particle size distribution file Not needed - calculated by program

18. Initial water surface elevation (ft) 0

Soil Data Soil Type Fraction in Eng. Soil

Biofilter Outlet/Discharge Characteristics

Outlet type: Broad Crested Weir

1. Weir crest length (ft) 10

2. Weir crest width (ft) 5

3. Height of datum to bottom of weir opening 2.7

Control Practice 4: Biofilter CP# 2 (DS) - DS Biofilters # 4

1. Top area (square feet) = 264908

2. Bottom area (square feet) = 75000

3. Depth (ft) 2

4. Biofilter width (ft) - for Cost Purposes Only 10

5. Infiltration rate (in/hr) = 6.5

6. Random infiltration rate generation? No

7. Infiltration rate fraction (side) 1

8. Infiltration rate fraction (bottom) 1

9. Depth of biofilter that is rock filled (ft) = 0
 10. Porosity of rock filled volume = 0

- (2) Maintain a record (in the form of a log book) of steps taken to implement the program referenced in (1) above. The log book shall be available for inspection by City staff at Owner's business during normal business hours, or at an alternate location approved by City staff. The log book shall catalog the action taken, who took it, when it was done, how it was done, and any problems encountered or follow-on actions recommended. Maintenance items listed in Attachment "A" shall be inspected on a monthly or more frequent basis as necessary. Owner is encouraged to photocopy the individual checklists in Attachment "A" and use them to complete its monthly inspections. These completed checklists would then, in combination, comprise the log book.

- (1) Implement or cause to be implemented the stormwater facility maintenance program herein as Attachment "A".

OWNER SHALL:

Owner has designed and installed or caused to be designed and installed certain structural and/or non-structural stormwater management measures in accordance with the approved stormwater management plan and permit on the property described above. In order to further the goals of the City to ensure the protection and enhancement of Sheboygan's water resources, and in consideration of the details and mutual agreements herein set forth, and other good and valuable considerations, the receipt and sufficiency of which are hereby acknowledged, the City and Owner hereby enter into this maintenance agreement. The responsibilities of each party to this Agreement are identified below.

[Legal Description]	Parcel Identification No. 5
59281328016	59281328017
59281328015	59281328011
59281328011	59281328015
59281328012	59281328016

A part of the NW ¼ and a part of Government Lots 1 & 2 and a part of the SW ¼ and a part of Government Lots 3 & 4 of Section 14 and a part of the SE ¼ of the SW ¼ and a part of Government Lot 4 of Section 11, T14N-R23E, City of Sheboygan, Sheboygan County, Wisconsin

All property owners are expected to conduct business in a manner that promotes environmental protection. This Agreement contains specific provisions with respect to maintenance of stormwater facilities. The authority to require maintenance and pollution source control is provided in the City of Sheboygan "Post-Construction Stormwater Management Zoning Ordinance," being Appendix E to the Sheboygan Municipal Code.

This Stormwater Facility Maintenance Agreement is made by and between the City of Sheboygan, Wisconsin ("City"), and the Kohler Company, 444 Highland Drive, Kohler, WI 53044 ("Owner").

STORMWATER FACILITIES MAINTENANCE AGREEMENT

RECITALS

The upkeep and maintenance of stormwater facilities is essential to the protection of water resources in the City of Sheboygan. All property owners are expected to conduct business in a manner that promotes environmental protection. This Agreement contains specific provisions with respect to maintenance of stormwater facilities. The authority to require maintenance and pollution source control is provided in the City of Sheboygan "Post-Construction Stormwater Management Zoning Ordinance," being Appendix E to the Sheboygan Municipal Code.

- (3) The Owner grants unrestricted authority to the City for access to any and all stormwater system features for the purpose of performing maintenance or repair as may become necessary under Remedies (1) and/or (2).
- (2) If at any time the City determines that the existing system creates any imminent threat to public health or welfare, the Director, or his/her designee, may take immediate measures to remedy said threat. No notice to the persons listed in Remedies (1), above, shall be required under such circumstances.
- (1) If the City determines that maintenance or repair work is required to be done to the stormwater facility existing on the Owner's property, the Director of the Department of Public Works, or his/her designee, shall give the Owner, and/or the person or agent in control of said property, notice of the specific maintenance and/or repair required. The Director or designee shall set a reasonable time in which such work is to be completed. If the above required maintenance and/or repair is not completed within the time set by the Director, or his/her designee, written notice will be sent to the persons who were given notice starting the day following the completion of the required maintenance and/or repair.

REMEDIES:

- (3) Review this agreement with Owner and modify it as necessary at least once every three (3) years.
- (2) Maintain public records of the results of site inspections, inform the Owner or other designated responsible party of the inspection results, and specifically indicate any corrective actions required to bring the stormwater management practice into proper working condition.
- (1) Provide technical assistance to Owner in support of its operation and maintenance activities conducted pursuant to its maintenance and source control programs. Said assistance shall be provided upon request, and as City time and resources permit, at no charge to Owner.

THE CITY OF SHEBOYGAN SHALL:

- (7) Prevent any unauthorized modifications to the approved stormwater management practices and prevent them from being dismantled, revised, altered or removed except as necessary for maintenance, repair or replacement. Any such actions shall be approved of by the City. Modifications to the approved stormwater management practices must be approved in advance by the City.
- (6) Permit authorized representatives of the City to perform corrective actions if the Owner does not make or cause to make required corrections within a specified time period and enter the amount due on the tax rolls and collect the money as a special charge against the property pursuant to state statutes, if payment is not made within thirty (30) days of submission of invoice to Owner for City performed corrective actions.

- (5) Provide the City with the name, address and telephone number of the business, the person or the firm responsible for plan implementation, if other than the Owner.
- (4) Maintain the approved stormwater management practices in accordance with the schedule referenced in (1) and (2).

- (3) Maintain the approved stormwater management practices in accordance with the schedule referenced in (1)

This document consists of four (4) typewritten pages, including the following attestation page.
